UNIVERSITY
*Private University established in Karnataka State by Act No.34 of year 2010
Recognized by the University Grants Commission (UGC), New Delhi*
Alliance School of Business

Introduction

- PowerQuery (known as Get & Transform in Excel)
- PowerQuery removes the need for complex formulas or advanced programming knowledge
- We can import or connect to external data, and shape data, change data type, or merge tables and many more.
- We can load query into Excel to create charts and reports.
- Periodically, we can refresh the data to make it up to date.

Get Data dialog

“Get Data” in PowerQuery enhances the way we discover and connect to data sources.

- In Excel, go to the Data tab on the ribbon.
- Click on Get Data > Get Data (Preview) to open Get Data dialog.
- Browse through the available data sources or use the search bar to find a specific source.
- Select desired data source and follow the prompts to import the data into Excel.

Four phases of PowerQuery

- 1) Connect - Make connections to data in the cloud, on a service, or locally
- 2) Transform - Shape data to meet business needs, while the original source remains unchanged
- 3) Combine - Integrate data from multiple sources to get a unique view into the data
- 4) Load - Complete query and load it into a worksheet or Data Model and periodically refresh it.

Benefits

- Time Efficiency
- Error Reduction
- User-Friendly Interface
- Data Integration
- Scalability
- Reusability and Consistency
- Automation of Data Refresh

With PowerQuery

- Import Data from Multiple Sources
- Clean and Transform Data
- Combine Data
- Automate Data Refresh
- Create Custom Columns
- Group and Aggregate Data
- Pivot and Unpivot Columns - columns to rows and vice versa
- Parameterize Queries
